

CS699 Research Progress Report – Team Situational Awareness

Benjamin Davis

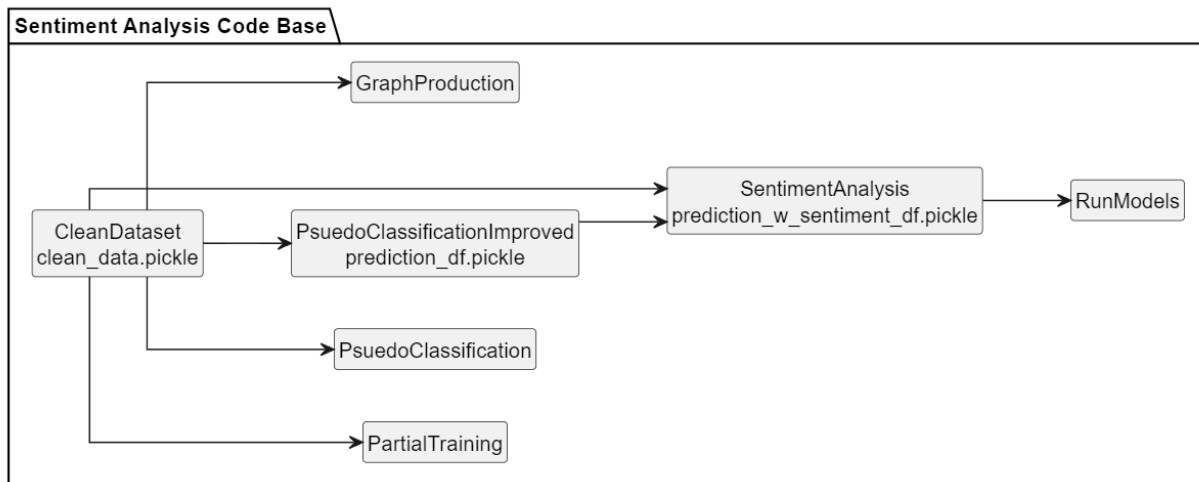

11/29/2024

Since the last report I have categorized the code in the repository. This process helped me understand how the dataset is cleaned, how the data frames are created and subsequently how the models have been trained. I had to duplicate the code into my personal repository due to a permissions issue with the existing repository. Following the setup, I was able to get all the repository running and producing results. Finally, I created a block diagram for the whole codebase and a set of activity diagrams for each file to show the processes of cleaning, training, writing, and graphing the data. These diagrams are attached below.

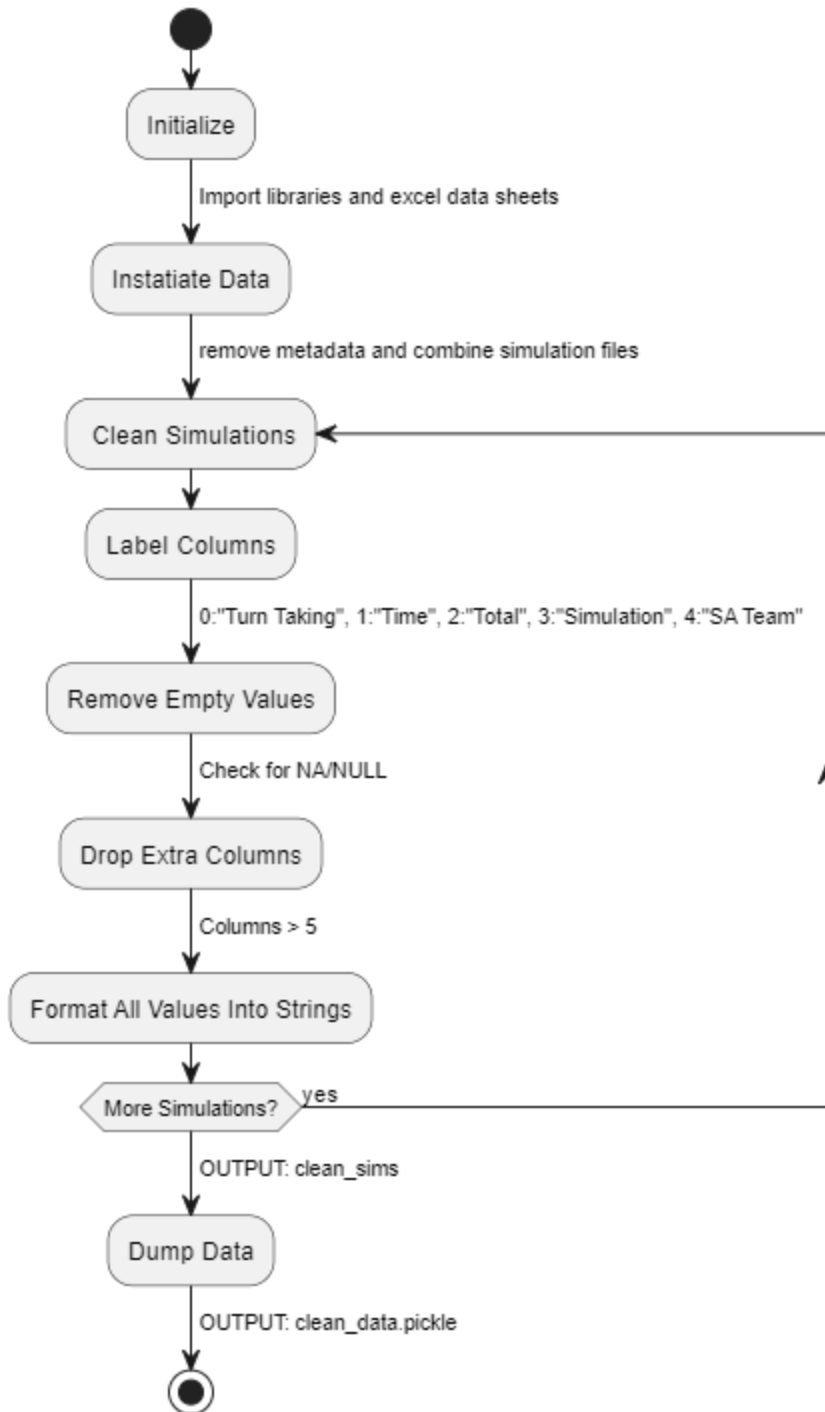

Next steps for the project will include the following:

1. Research application of the Team SA project to agile scrum
2. Process the results to determine which train test split percentage resulted in the highest accuracy.

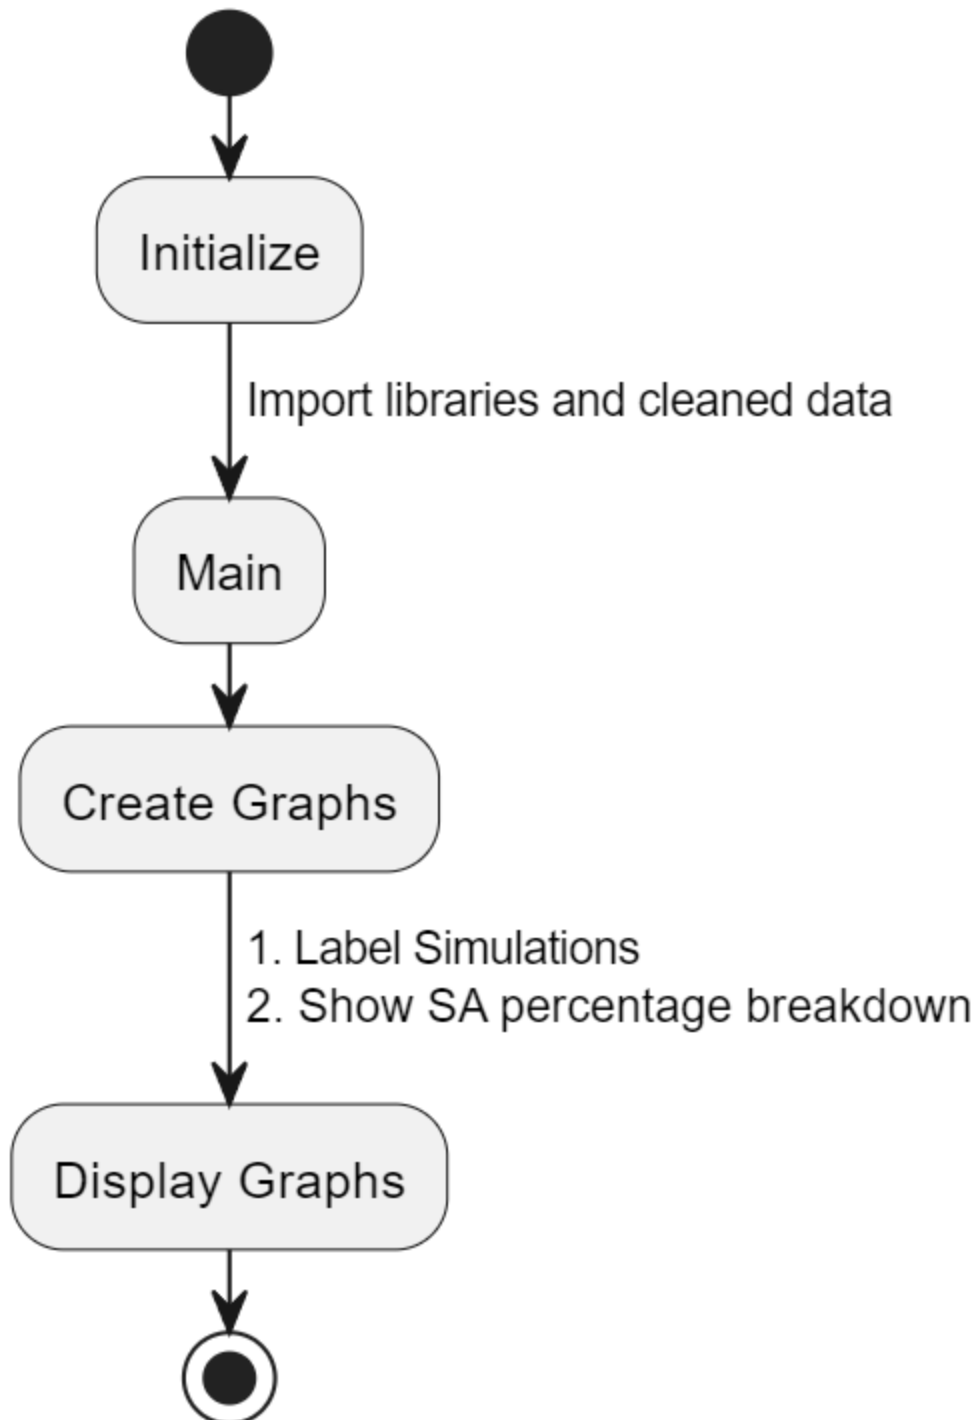

Sentiment Analysis Code Base Block

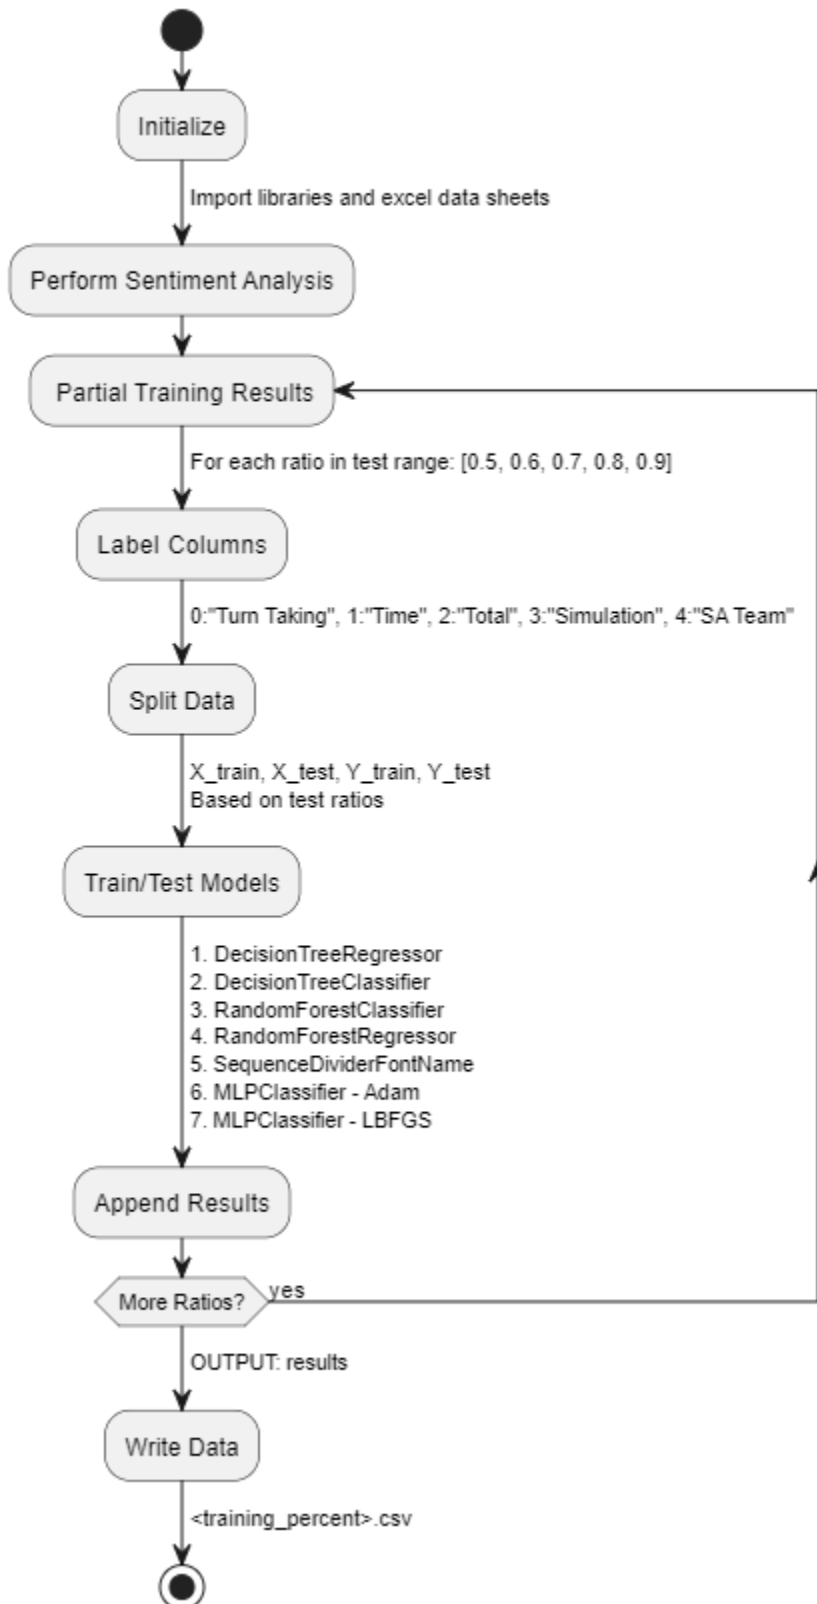

CleanDataset Activity

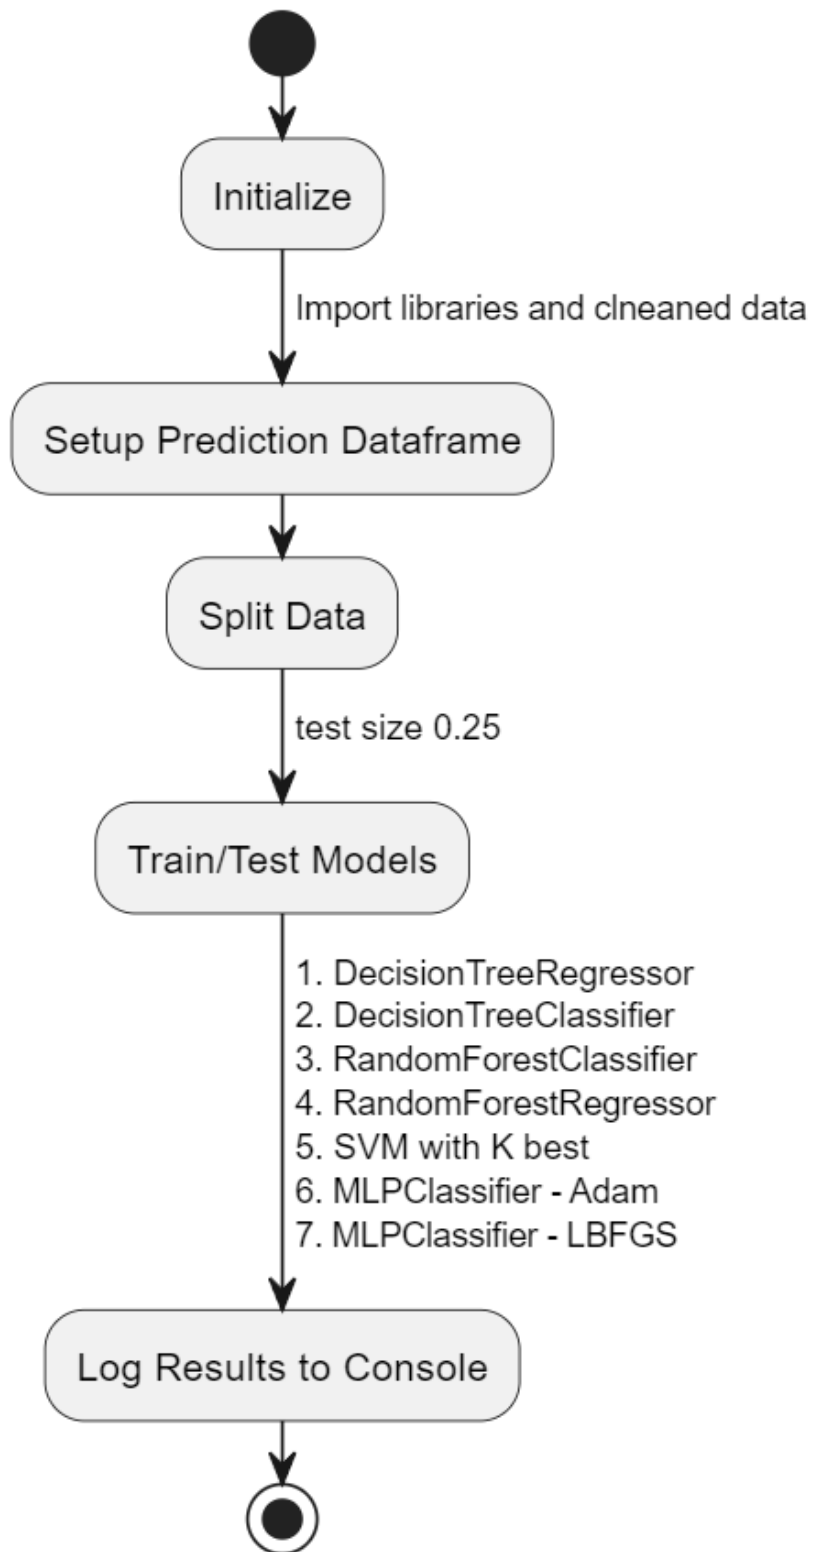

GraphProduction Activity

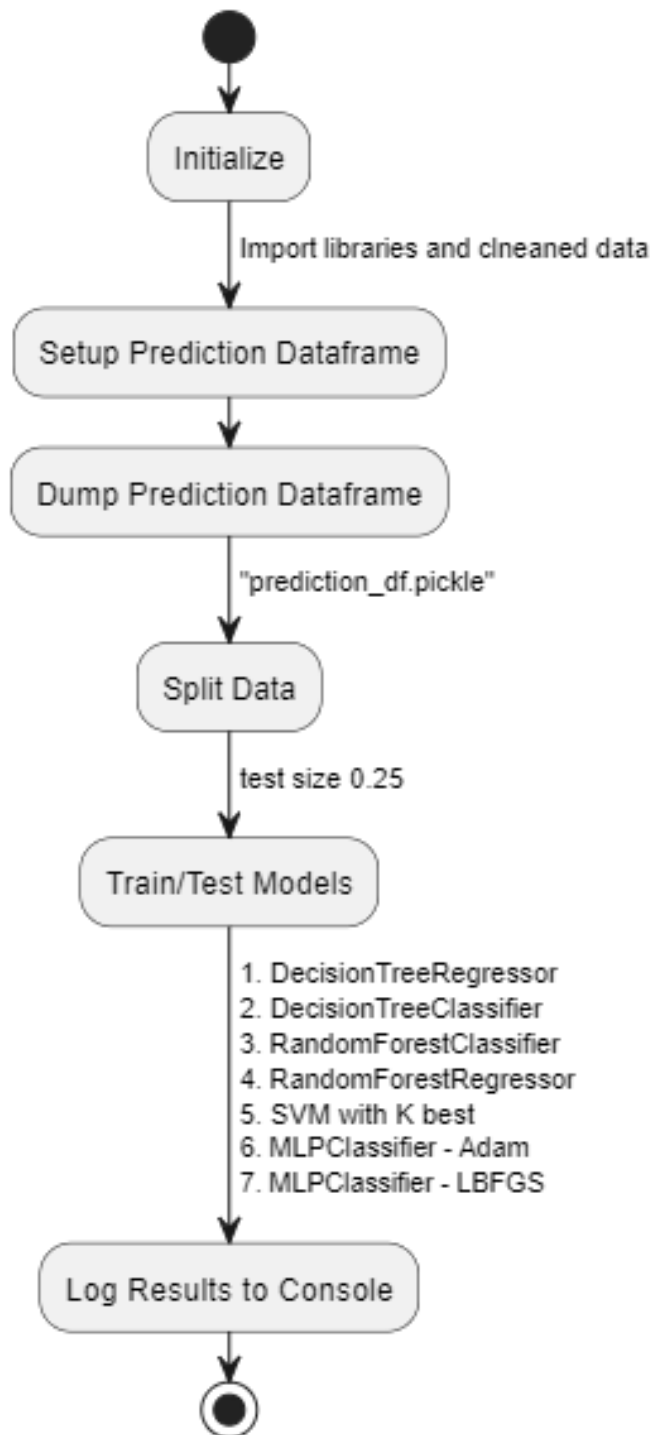

Partial Training Activity

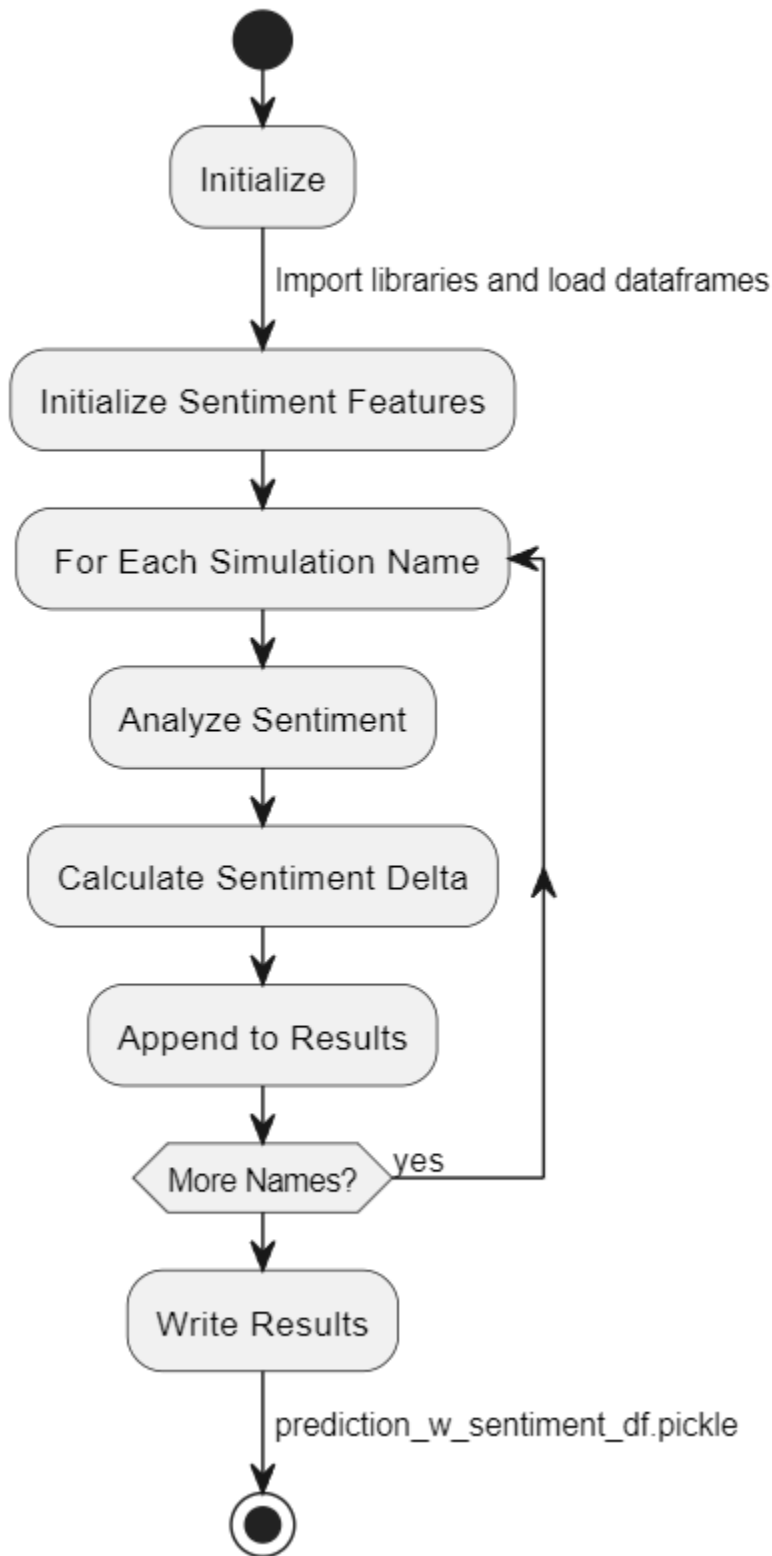

PseudoClassification Activity

PsuedoClassificationImproved Activity

SentimentAnalysis Activity

RunModels Activity
